

Chapter 9

Limitation of the Study

Nevertheless, a lot of innovations have been the outcome of this empirical study, the following limitations have also been traced which stand as a barrier to explain certain things as should have been

1. The number of variables could have been more and the relevancy index of the study should have been indexed through some small scale pilot study.
2. The high level of residual effect can be attributed to the high value of CV of certain variables.
3. As a concept, energy metabolism in Indian farming is complex and rendered indiscernible to some extent by the respondents, the responses are suffering from fair amount of subjectivity.
4. The number of respondents could have been more and high level of variance could have been explained therewith, but time and resources stand as a bale.
5. The participatory analysis and delineation could have been a better option to justify the domain of inexplicability in a better and wider way.
6. Since, tools of energy calculation and estimation, that to in a natural set up, are not enough available, they are not full proof either.
