

# Chapter 6

## Results and Discussion

---

This chapter deals with results derived by statistical analysis after interpretation of raw field data and discussion of each result in a systematic manner. The results and their pertaining discussions are presented according to the specific objectives of the study.

### **Agro-economic and Socio-psychological profile of the selected respondents**

A profile provides for cross-sectional information of a situation. Agro-economic status refers to the position of an individual with reference to various indicators of agronomic condition in a farming community. The Socio-psychological status refers to the position of an individual with reference to various indicators of socio-economic condition in a farming community. Agro-economic and Socio-psychological status of selected respondent was calculated by adding the scores assigned to a category of each item.

**Table: 6.1: Agro-economic and Socio-psychological profile of selected respondents.****(Conventional method of rice)**

Items	Category	Frequency	Percentage (%)
Age (X <sub>1</sub> )	40-49	39	39
	50-59	29	29
	60-69	23	23
	70-79	9	9
Education (X <sub>2</sub> )	Illiterate		
	Primary	1	1
	Secondary	18	18
	Higher secondary	38	38
	Graduate and above	27	27
Family education status (X <sub>3</sub> )	1.4-2.24	14	14
	2.24-3.08	29	29
	3.08-3.92	30	30
	3.92-4.76	27	27
Primary occupation (X <sub>41</sub> )	Labour		
	Caste occupation	13	13
	Business	11	11
	Independent profession	20	20
	Cultivation	9	9
	Service	41	41
Secondary occupation (X <sub>42</sub> )	No		
	Labour	6	6
	Caste occupation	9	9
	Business	9	9
	Independent profession	10	10
	Cultivation	7	7
		59	59

Caste (X <sub>5</sub> )	Scheduled tribe	17	17
	Scheduled caste	24	24
	OBC	33	33
	General	26	26
Family type (X <sub>6</sub> )	Single family	58	58
	Joint family	42	42
Family size (X <sub>7</sub> )	Up to 5 members	38	38
	Above 5 members	62	62
Family income primary (X <sub>81</sub> )	Less than 2500	60	60
	2500-5000	32	32
	5000-7500	5	5
	7500-10000	2	2
	More than 10,000	1	1
Family income secondary (X <sub>82</sub> )	0-1500	74	74
	1500-3000	19	19
	3000-4500	6	6
	4500 and above	1	1
Farm size (X <sub>9</sub> )	Less than 2.4	51	51
	2.4-4.4	25	25
	4.4-6.4	11	11
	6.4-8.4	8	8
	Above 8.4	5	5

Social participation (X <sub>10</sub> )	None	33	33
	Member of one organization	36	36
	Member of more than one	18	18
	Office holder	7	7
	Wider public leader	6	6
Risk orientation (X <sub>11</sub> )	0-1.5	8	8
	1.5-3	11	11
	3-4.5	33	33
	4.5-6	37	37
	6-7.5	11	11
Index of farm mechanization (X <sub>12</sub> )	20-39	33	33
	40-59	36	36
	60-79	17	17
	80-99	14	14
Cropping intensity (X <sub>13</sub> )	Less than 50	3	3
	50-100	48	48
	100-150	39	39
	150-200	10	10
Selling % (X <sub>14</sub> )	40-55	5	5
	55-70	12	12
	70-85	52	52
	85-100	31	31
Debt (X <sub>15</sub> )	No	30	30
	Yes	70	70
Migration (X <sub>16</sub> )	No	88	88
	Yes	12	12
Seed rate % (X <sub>21</sub> )	90-110	31	31
	110-130	41	41
	130-150	23	23
	150-170	5	5
Fertilizer % (X <sub>22</sub> )	53.3-73.3	12	12
	73.3-93.3	33	33
	93.3-113.3	31	31
	113.3-133.3	24	24

Pesticide% ( $X_{23}$ )	33.3-133.3	50	50
	133.3-233.3	34	34
	233.3-333.3	10	10
	333.3-433.3	6	6
Weed management% ( $X_{24}$ )	53.3-93.3	30	30
	93.3-133.3	49	49
	133.3-173.3	20	20
	173.3-213.3	1	1
Water management% ( $X_{25}$ )	Less than 25	27	27
	25-74	25	25
	75-124	40	40
	Above 125	8	8
Irrigation index% ( $X_{26}$ )	Less than 25	30	30
	25-50	26	26
	50-75	30	30
	75-100	14	14
Sowing time ( $X_{27}$ )	15june-25 June	40	40
	26 june-5 July	24	24
	6 july-15july	11	11
	16 july-25 July	25	25
Varietal change ( $X_{28}$ )	Due to climate change(1)	58	58
	Due to other reason(0)	42	42
Farm power ( $X_{29}$ )	No drought animal(0)		
	1 to 2 drought animal(2)	13	13
	3 to 4 drought animal(4)	38	38
	5 to 6 drought animal(6)	24	24
		25	25

Change in rainfall pattern over last 20 year (X <sub>30</sub> )	(Out of 10 scale)		
	Less than 2	2	2
	2-3	14	14
	4-5	12	12
	6-8	34	34
	Above 8	38	38
Change pattern in temperature (day/night) over last 20 year (X <sub>31</sub> )	(0- 10 scale)		
	Less than 2	4	4
	2-3	11	11
	4-5	13	13
	6-8	40	40
	Above 8	32	32
Change pattern in weather disaster over last 20 year (X <sub>32</sub> )	(0- 10 scale)		
	Less than 2	3	3
	2-3	13	13
	4-5	17	17
	6-8	38	38
	Above 8	29	29
Change in seasonal pattern over last 20 year (X <sub>33</sub> )	(0- 10 scale)		
	Less than 2	3	3
	2-3	13	13
	4-5	17	17
	6-8	41	41
	Above 8	26	26
Change pattern in insect/ pests & diseases over last 20 year (X <sub>34</sub> )	(0- 10 scale)		
	2-3	4	4
	4-5	10	10
	6-8	45	45
	Above 8	41	41
Change pattern in weed problem over last 20 year (X <sub>35</sub> )	(0- 10 scale)		
	Less than 2	2	2
	2-3	8	8
	4-5	38	38
	6-8	44	44
	Above 8	8	8

## Discussion

**Table 6.1**, it represents the frequency distribution of the respondents according to their Age, Education, Family education status, Primary occupation, Secondary occupation, Caste, Family type, Family size, Family income primary, Family income secondary, Farm size, Social participation, Risk orientation, Index of farm mechanization, Cropping intensity, Selling%, Debt, Migration, Seed rate%, Fertilizer%, Pesticide%, Weed management%, Water management%, Irrigation index%, Sowing time, Varietal change, Farm power, Change in rainfall pattern over last 20 year, Change pattern in temperature(day/night) over last 20 year, Change pattern in weather disaster over last 20 year, Change in seasonal pattern over last 20 year, Change pattern in insect/ pests & diseases over last 20 year, Change pattern in weed problem over last 20 year.

### Age

The attribute caste has categorized four distinct categorized viz. 40-49, 50-59, 60-69, 70-79. The major percentage of the respondent is 40-49 (39%) and 50-59 category (29 %). 60-69 category (23%) and very less in 70-79 (9%) category.

### Education

The attribute education has been five distinct categories viz. illiterate, primary, secondary, higher secondary, graduate and above etc. The major percentage of the respondent is secondary (38%) under the category education, followed by primary (18%),

higher secondary (27%), graduate and above (16%), illiterate (1%).

### **Family education status**

The attribute family education status has 4 distinct categories according to their education score viz. illiterate, primary, secondary, higher secondary, graduate and above etc. The major percentage of the family education status (30%) under the category 3.08-3.92. (secondary and higher secondary group).

### **Primary occupation**

The attribute primary occupation has 6 distinct categories. The major percentage of the respondents (41%) under the category cultivation followed by the (20%) in business category and very less (6%) in service category.

### **Secondary occupation**

The attribute secondary occupation has 6 distinct categories. The major percentage of the respondents (59%) under the category cultivation followed by the (10%) in business category and very less (6%) in no any secondary occupation category.

### **Caste**

The attribute caste has 4 distinct categories. The major percentage of the respondents (33%) under the Obc (Other backward class) category followed by the (26%) in general category and very less (17%) in scheduled tribe category.

### **Family type**

The attribute family type has 2 distinct categories. The major percentage of the respondents (58%) under the single family category followed by the (42%) in joint family category.

### **Family size**

The attribute family size has 2 distinct categories. The major percentage of the respondents (62%) under the above 5 member category followed by the (38%) in up to 5 members in the family category.

### **Family income primary**

The attribute family income primary has 5 distinct categories. The major percentage of the respondents (60%) under less than 2500 category followed by the (32%) under 2500-5000 category.

### **Family income secondary**

The attribute family income secondary has 4 distinct categories. The major percentage of the respondents (74%) under 0-1500 category followed by the (19%) under 1500-3000 category.

### **Farm size**

The attribute farm size has 5 distinct categories. The major percentage of the respondents (51%) under less than 2.4 hectare farm size category followed by the (25%) under 2.4-4.4 hectare farm size category.

**Social participation**

The attribute Social participation has 5 distinct categories. The major percentage of the respondents (36%) under the member of one organization category followed by the (33%) under no any social participation category.

**Risk orientation**

The attribute risk orientation has 5 distinct categories. The major percentage of the respondents (37%) under the 4.5-6 category means in between agree and strongly agree category towards the risk orientation followed by the (33%) under 3-4.5 means disagree and undecided category.

**Index of farm mechanization**

The attribute index of farm mechanization has 4 distinct categories on the basis of their total score. The major percentage of the respondents (36%) under the 40-59 score category followed by the (33%) under 20-39 score category.

**Cropping intensity**

The attribute cropping intensity has 3 distinct categories. The major percentage of the respondents (48%) under the 50-100% category followed by the (39%) under 100-150% cropping intensity category. in very less (3%) under less than 50 categories.

### **Selling %**

The attribute selling % has 4 distinct categories on the basis of their total selling of produce. The major percentage of the respondents (52%) under the 70-85 category followed by the (31%) under 85-100 category.

### **Debt**

The attribute debt has 2 distinct categories. The major percentage of the respondents (70%) under the yes category followed by the (30%) under no category.

### **Migration**

The attribute migration has 2 distinct categories. The major percentage of the respondents (88%) under the no category followed by the (12%) under yes category those wanted to migrate from one place to another place.

### **Seed Rate%**

The attribute seed rate% has 4 distinct categories. The major percentage of the respondents (41%) under the 110-130 category followed by the (31%) under 90-110 category.

### **Fertilizer%**

The attribute fertilizer% has 4 distinct categories. The major percentage of the respondents (33%) under the 73.3-93.3 category followed by the (31%) under 93.3-113.3 category.

**Pesticide%**

The attribute pesticide% has 4 distinct categories. The major percentage of the respondents (50%) under the 33.3-133.3 category followed by the (34%) under 133.3-233.3 category. In very less (6%) under 333.3-433.3 category.

**Weed management%**

The attribute weed management% has 4 distinct categories. The major percentage of the respondents (49%) under the 93.3-133.3 category followed by the (30%) under 53.3-93.3 category. In very less (1%) under 173.3-213.3 category.

**Water management%**

The attribute water management% has 4 distinct categories. The major percentage of the respondents (40%) under the 75-124 category followed by the (27%) under less than 25 category. In very less (8%) under above 125 category.

**Irrigation index%**

The attribute irrigation index% has 4 distinct categories. The major percentage of the respondents (30%) under the 50-75 and less than 25 categories. In very less (14%) under above 75-100 category.

**Sowing time**

The attribute sowing time has 4 distinct categories. The major percentage of the respondents (40%) under the 15 June- 25 June

category. followed by the (25%) under 16 July-25 July category. In very less (11%) under 6 July- 15 July category.

### **Varietal change**

The attribute varietal change has 2 distinct categories. The major percentage of the respondents (58%) under the 1 category. followed by the (42%) under 0 categories.

### **Farm power**

The attribute farm power has 4 distinct categories. The major percentage of the respondents (38%) under 1 to 2 drought animal category. followed by the (25%) under 5-6 drought animal category.

### **Change in rainfall pattern over last 20 year**

The attribute change in rainfall pattern over last 20 year has 5 distinct categories. The major percentage of the respondents (38%) under above 8 category. followed by the (34%) under 6-8 category. In very less (2%) under less than 2 category.

### **Change pattern in temperature (day/night) over last 20 year**

The attribute change pattern in temperature (day/night) over last 20 year has 5 distinct categories. The major percentage of the respondents (40%) under above 6-8 category. followed by the (32%) under above 8 categories. In very less (4%) under less than 2 category.

**Change pattern in weather disaster over last 20 year**

The attribute change pattern in weather disaster over last 20 year has 5 distinct categories. The major percentage of the respondents (38%) under above 4-5 category. followed by the (29%) under 6-8 categories. In very less (3%) under less than 2 category.

**Change in seasonal pattern over last 20 year**

The attribute change in seasonal pattern over last 20 year has 5 distinct categories. The major percentage of the respondents (41%) under above 4-5 category. followed by the (26%) under 6-8 categories. In very less (3%) under less than 2 category.

**Change pattern in insect/ pests & diseases over last 20 year**

The attribute change pattern in insect/ pests & diseases over last 20 year has 4 distinct categories. The major percentage of the respondents (45%) under above 6-8 category. followed by the (41%) under above 8 categories. In very less (4%) under less than 2-3 category.

**Change pattern in weed problem over last 20 year**

The attribute change pattern in weed problem over last 20 year has 5 distinct categories. The major percentage of the respondents (44%) under above 6-8 category. followed by the (38%) under 4-5 categories. In very less (2%) under less than 2 category.

**Extension communication profile of selected respondents.  
(Conventional method of rice)**

**Table 6.2: Mass media exposure of selected respondents**

Exposure to	Always		Very often		Some times		Very few		Never	
	F	%	F	%	F	%	F	%	F	%
Radio	25	25	27	27	33	33	11	11	4	4
Television	38	38	18	18	26	26	10	10	8	8
Educational film	9	9	10	10	15	15	18	18	48	48
News paper	18	18	4	4	10	10	30	30	38	38
Agril. magazine	0	0	0	0	2	2	16	16	82	82
Agricultural exhibition	7	7	14	14	21	21	27	27	31	31

## Discussion

**Table 6.2**, showed that, in case of selected respondents the majority of the respondent had some time (33%) listen radio, followed by very often (27%), always (25%), very few (11%) and never (4%) listen radio respectively.

In case of selected respondents the majority of the respondent had always (38%) watching television, followed by sometimes (26%), very often (18%), very few (10%) and never (8%) watching television.

In case of selected respondents the majority of the respondent had never (48%) watching education film, followed by very few watching (18%), sometimes watching (15%) and very often watching (10%), and always watching (9%) educational film.

In case selected respondents the majority of the respondent had never reading (38%) news paper, followed by very few reading (30%), always reading (18%), sometimes reading (10%) and very often reading (4 %).

In case of selected respondents the majority of the respondent had never reading (82%) agril. magazine, followed by very few reading (16%), sometime reading (2%) and no any respondents in always and very often category.

In case selected respondents the majority of the respondent had never (31%) going to agricultural exhibition, followed by very few going exhibition (27%), sometime (21%), very often going (14%) and always going (7%) agricultural exhibition.

**Table 6.3: Utilization of personal cosmopolite sources of information**

Statement	Always	Sometimes	Never
i) I use to travel outside my village during last year to visit place.	70	21	9
ii) I personally visited agriculture expert for his advice about my occupation.	17	43	40
iii) I use to contact with agriculture expert who visited my village for his advice/help during last year.	13	31	56
iv) I use to visit farmers of outside my village and seek their advice.	23	42	35
v) I use to invite people who visited my village for discussion about village development during last year.	13	18	69

**Discussion:**

**Table 6.3**, showed that, in case of selected respondents the majority of the respondents always (70%) use to travel outside their village during last year to visit place, followed by (21%) sometimes use to travel outside their village during last year to visit place and never (9%) use to travel outside their village during last year to visit place.

In case of selected respondents the majority of the respondents sometimes (43%) personally visited agriculture expert for their advice about their occupation, followed by (40%) never personally visited agriculture expert for their advice about their occupation and always (17%) personally visited agriculture expert for their advice about their occupation.

In case of selected respondents the majority of the respondents never (56%) use to contact with agriculture expert who visited their village for their advice/help during last year, followed by sometimes (31%) use to contact with agriculture expert who visited their village for their advice/help during last year and always (13%) use to contact with agriculture expert who visited their village for their advice/help during last year.

In case of selected respondents the majority of the respondents sometimes (42%) use to visit farmers of outside their village and seek their advice, followed by never (35%) use to visit farmers of outside their village and seek their advice and always (23%) use to visit farmers of outside their village and seek their advice.

In case of selected respondents the majority of the respondents never (69%) use to invite people who visited their village for discussion about village development during last year, followed by sometimes (18%) use to invite people who visited their village for discussion about village development during last year and always (13%) use to invite people who visited their village for discussion about village development during last year.

**Table 6.4: Utilization of personal localite sources of information**

Source	Very often	often	Sometimes	Never
i) Local agents	31	42	17	10
ii) Local leader	9	32	23	36
iii) Friends/relative/neighbors	43	12	31	14
iv) Experienced/ progressive farmers	18	31	40	11

#### Discussion:

**Table 6.4**, showed that, in case of selected respondents the majority of the respondents often (42%) had utilized the personal localite sources of information from local agents, followed by very often (31%) respondents had utilized the personal localite sources of information from local agents, sometimes (17%) had utilized the personal localite sources of information from local agents and never (10%) respondents had utilized the personal localite sources of information from local agents.

In case of selected respondents the majority of the respondents never (36%) had utilized the personal localite sources of information from local leaders; followed by often

(32%) respondents had utilized the personal localite sources of information from local leaders, sometimes (23%) respondents had utilized the personal localite sources of information from local leaders and very often (9%) respondents had utilized the personal localite sources of information from local leaders.

In case of selected respondents the majority of the respondents very often (43%) had utilized the personal localite sources of information from friends/ relative/neighbors, followed by sometimes (31%) respondents had utilized the personal localite sources of information from friends/ relative/neighbors, never (14%) respondents had utilized the personal localite sources of information from friends/ relative/neighbors and often (12%) had utilized the personal localite sources of information from friends/ relative/neighbors.

In case of selected respondents the majority of the respondents sometimes (40%) had utilized the personal localite sources of information from experienced/ progressive farmers, followed by often (31%) respondents had utilized the personal localite sources of information from experienced/ progressive farmers, very often (18%) had utilized the personal localite sources of information from experienced/ progressive farmers and never (11%) respondents had utilized the personal localite sources of information from experienced/ progressive farmers.

**Table 6.5: Contact with extension personal**

<b>S N</b>	<b>Extension worker</b>	<b>Most often</b>	<b>Oft en</b>	<b>Someti mes</b>	<b>Rare ly</b>	<b>Nev er</b>
1	A.D.O.	17	32	19	9	23
2	B.D.O.	9	16	25	12	38
3	Agril supervisor	21	5	17	41	16
4	Agril officer (T & V)	32	11	14	9	34
5	Agril scientist	15	9	31	12	33
6	Fertilizer dealer	41	30	19	7	3
7	Private company(seed/pesticide )	5	7	14	9	65

**Discussion:**

**Table 6.5**, showed that, in case of selected respondents the majority of the respondents often (32%) had contact with Agriculture development officer (A.d.o.), followed by never (23%) had contact with Agriculture development officer (A.d.o.), sometimes (19%) had contact with Agriculture development officer (A.d.o.), most often (17%) had contact with Agriculture development officer (A.d.o.) and rarely (9%) had contact with Agriculture development officer (A.d.o.).

In case of selected respondents the majority of the respondents never (38%) had contact with Block development officer (B.d.o.), followed by sometimes (25%) had contact with Block development officer (B.d.o.), often (16%) had contact with Block development officer (B.d.o.), rarely (12%) had contact with Block development officer (B.d.o.) and most often (9%) had contact with Block development officer (B.d.o.).

In case of selected respondents the majority of the respondents rarely (41%) had contact with agril supervisor, followed by most often (21%) had contact with agril supervisor, sometimes (17%) had contact with agril supervisor, never (16%) had contact with agril supervisor and often (5%) had contact with agril supervisor.

In case of selected respondents the majority of the respondents never (34%) had contact with agril officer (t & v), followed by most often (32%) had contact with agril officer (t & v), sometimes (14%) had contact with agril officer (t & v), often (11%) had contact with agril officer (t & v), and rarely (9%) had contact with agril officer (t & v).

In case of selected respondents the majority of the respondents never (33%) had contact with agril scientist, followed by sometimes (31%) had contact with agril scientist, most often (15%) had contact with agril scientist, rarely (12%) had contact with agril scientist, and often (9%) had contact with agril scientist.

In case of selected respondents the majority of the respondents most often (41%) had contact with fertilizer dealer, followed by often (30%) had contact with fertilizer dealer, sometimes (19%) had contact with fertilizer dealer, rarely (7%) had contact with fertilizer dealer, and never (3%) had contact with fertilizer dealer.

In case of selected respondents the majority of the respondents never (65%) had contact with private company

(seed/pesticide), followed by sometimes (14%) had contact with private company (seed/pesticide), rarely (9%) had contact with private company (seed/pesticide), often (7%) had contact with private company (seed/pesticide), and most often (5%) had contact with private company (seed/pesticide).

**Table 6.6: Agro-economic and Socio-psychological profile of selected respondents. (SRI method of rice)**

Items	Category	Frequency	Percentage (%)
Age (X <sub>1</sub> )	40-49	33	33
	50-59	31	31
	60-69	22	22
	70-79	14	14

**Discussion:**

**Table 6.6,** Represents the frequency distribution of the respondents according to their age, education, family education

status, primary occupation, secondary occupation, caste, family type, family size, family income primary, family income secondary, farm size, social participation, risk orientation, index of farm mechanization, cropping intensity, selling%, debt, migration, seed rate%, fertilizer%, pesticide%, weed management%, water management%, irrigation index%, sowing time, varietal change, farm power, change in rainfall pattern over last 20 year, change pattern in temperature(day/night) over last 20 year, change pattern in weather disaster over last 20 year, change in seasonal pattern over last 20 year, change pattern in insect/ pests & diseases over last 20 year, change pattern in weed problem over last 20 year.

### **Age**

The attribute caste has categorized four distinct categorized viz. 40-49, 50-59, 60-69, 70-79. The major percentage of the respondent is 40-49 (33%) and 50-59 category (31 %). 60-69 category (22%) and very less in 70-79 (14%) category.

### **Education**

The attribute education has been five distinct categories viz. Illiterate, Primary, Secondary, Higher secondary, Graduate and above etc. The major percentage of the respondent is secondary (42%) under the category secondary education, followed by higher secondary (23%). In very less (2%) under illiterate category.

**Family education status**

The attribute family education status has 4 distinct categories according to their education score viz. illiterate, primary, secondary, higher secondary, graduate and above etc. The major percentage of the family education status (35%) under the category 2-3. (Secondary and higher secondary group).

**Primary occupation**

The attribute primary occupation has 6 distinct categories. The major percentage of the respondents (42%) under the category cultivation followed by the (23%) in business category and very less (1%) in labour category.

**Secondary occupation**

The attribute secondary occupation has 6 distinct categories. The major percentage of the respondents (58%) under the category cultivation followed by the (20%) in none category and very less (4%) in labour category.

**Caste**

The attribute caste has 4 distinct categories. The major percentage of the respondents (27%) under the OBC (Other backward class) & general category and very less (20%) in scheduled tribe category.

### **Family type**

The attribute family type has 2 distinct categories. The major percentage of the respondents (54%) under the single family category followed by the (46%) in joint family category.

### **Family size**

The attribute family size has 2 distinct categories. The major percentage of the respondents (56%) under the above 5 member category followed by the (44%) in up to 5 members in the family category.

### **Family income primary**

The attribute family income primary has 5 distinct categories. The major percentage of the respondents (36%) under less than 2500 category followed by the (24%) under 2500-5000 category.

### **Family income secondary**

The attribute family income secondary has 4 distinct categories. The major percentage of the respondents (86%) under 0-1500 category followed by the (9%) under 1500-3000 category.

### **Farm size**

The attribute farm size has 5 distinct categories. The major percentage of the respondents (59%) under less than 2.4 hectare farm size category followed by the (27%) under 2.4-4.4 hectare farm size category.

**Social participation**

The attribute social participation has 5 distinct categories. The major percentage of the respondents (52%) under wider public leader category followed by the (34%) under member of one organization category.

**Risk orientation**

The attribute risk orientation has 5 distinct categories. The major percentage of the respondents (23%) under the 3-4.5 category means in between dis-agree and undecided category towards the risk orientation followed by the (22%) under 0-1.5 means strongly dis- agree category.

**Index of farm mechanization**

The attribute index of farm mechanization has 4 distinct categories on the basis of their total score. The major percentage of the respondents (38%) under the 40-59 score category followed by the (22%) under 20-39 score category.

**Cropping intensity**

The attribute cropping intensity has 3 distinct categories. The major percentage of the respondents (51%) under the 50-100% category followed by the (43%) under 100-150% cropping intensity category. In very less (6%) under 150-200 category.

**Selling%**

The attribute selling% has 4 distinct categories on the basis of their total selling of produce. The major percentage of the

respondents (39%) under the 70-85 category followed by the (29%) under 85-100 category.

### **Debt**

The attribute debt has 2 distinct categories. The major percentage of the respondents (79%) under the yes category followed by the (21%) under no category.

### **Migration**

The attribute migration has 2 distinct categories. The major percentage of the respondents (92%) under the no category followed by the (8%) under yes category those wanted to migrate from one place to another place.

### **Seed rate%**

The attribute seed rate% has 4 distinct categories. The major percentage of the respondents (48%) under the 100-199 category followed by the (30%) under 200-299 category.

### **Fertilizer%**

The attribute fertilizer% has 4 distinct categories. The major percentage of the respondents (43%) under the 93.3-113.3 category followed by the (36%) under 73.3-93.3 category.

### **Pesticide%**

The attribute pesticide% has 4 distinct categories. The major percentage of the respondents (56%) under the 70-119 category followed by the (33%) under 120-169 category. In very less (2%) under 220-269 category.

**Weed management%**

The attribute weed management% has 4 distinct categories. The major percentage of the respondents (63%) under the 80-120 category followed by the (22%) under 120-160 category. In very less (7%) under above 160 category.

**Water management%**

The attribute water management% has 4 distinct categories. The major percentage of the respondents (51%) under the 100-120 category followed by the (34%) under 80-100 category. In very less (1%) under above 120 category.

**Irrigation index%**

The attribute irrigation index% has 3 distinct categories. The major percentage of the respondents (53%) under the 70-90 categories. In very less (10%) under less than 70 category.

**Sowing time**

The attribute sowing time has 3 distinct categories. The major percentage of the respondents (38%) under the 15 July – 23 July category. followed by the (32%) under 24 July-31 July category. In very less (30%) under 1 august – 8 august category.

**Varietal change**

The attribute varietal change has 2 distinct categories. The major percentage of the respondents (64%) under the 1 category. followed by the (36%) under 0 categories.

### **Farm power**

The attribute farm power has 4 distinct categories. The major percentage of the respondents (38%) under 1 to 2 drought animal category. followed by the (23%) under 3-4 drought animal category.

### **Change in rainfall pattern over last 20 year**

The attribute change in rainfall pattern over last 20 year has 5 distinct categories. The major percentage of the respondents (50%) under 4-5 category. followed by the (28%) under 6-8 category. In very less (1%) under less than 2 category.

### **Change pattern in temperature (day/night) over last 20 year**

The attribute change pattern in temperature (day/night) over last 20 year has 5 distinct categories. The major percentage of the respondents (51%) under above 4-5 category. followed by the (23%) under 2-3 categories. In very less (3%) under less than 2 category.

### **Change pattern in weather disaster over last 20 year**

The attribute change pattern in weather disaster over last 20 year has 5 distinct categories. The major percentage of the respondents (46%) under above 6-8 category, followed by the (20%) under 4-5 categories. In very less (3%) under less than 2 category.

**Change in seasonal pattern over last 20 year**

The attribute change in seasonal pattern over last 20 year has 5 distinct categories. The major percentage of the respondents (51%) under above 6-8 category, followed by the (18%) under 4-5 categories. In very less (4%) under less than 2 category.

**Change pattern in insect/ pests & diseases over last 20 year**

The attribute change pattern in insect/ pests & diseases over last 20 year has 4 distinct categories. The major percentage of the respondents (53%) under above 8 category, followed by the (30%) under 6-8 categories. In very less (3%) under 2-3 category.

**Change pattern in weed problem over last 20 year**

The attribute change pattern in weed problem over last 20 year has 3 distinct categories. The major percentage of the respondents (74%) under above 8 category, followed by the (21%) under 6-7 categories. In very less (5%) under 4-5 category.

**Extension communication profile of selected respondents.  
(SRI method of rice)**

**Table 6.7: Mass media exposure of selected respondents**

Exposure to	Always		Very often		Some times		Very few		Never	
	F	%	F	%	F	%	F	%	F	%
Radio	35	35	9	9	15	15	11	11	30	30
Television	29	29	27	27	23	23	10	10	11	11

Educational film	12	12	9	9	17	17	21	21	41	41
News paper	36	36	14	14	12	12	23	23	15	15
Agril. magazine	7	7	4	4	13	13	18	18	58	58
Agricultural Exhibition	11	11	10	10	27	27	35	35	17	17

**Discussion**

**Table 6.7**, showed that, in case of selected respondents the majority of the respondent had always (35%) listen radio, followed by never (30%), sometimes (15%), very few (11%) and very often (9%) listen radio respectively.

In case of selected respondents the majority of the respondent had always (29%) watching television, followed by very often (27%), sometimes (23%), never (11%) and very few (10%) watching television.

In case of selected respondents the majority of the respondent had never (41%) watching education film, followed by very few watching (21%), sometimes watching (17%) and always watching (12%), and very often (9%) watching educational film.

In case selected respondents the majority of the respondent had always reading (36%) news paper, followed by very few reading (23%), never reading (15%), very often reading (14%) and sometimes reading (12%).

In case of selected respondents the majority of the respondent had never reading (58%) agril. magazine, followed by

very few reading (18%), sometime reading (13%) always reading (7%) and very often (4%) reading argil magazine.

In case selected respondents the majority of the respondent had very few (35%) going to agricultural exhibition, followed by sometimes going exhibition (27%), never (17%) , always going (11%) and very often going (10%) agricultural exhibition.

**Table 6.8: Utilization of personal cosmopolite sources of information**

Statement	Always	Sometimes	Never
i) I use to travel outside my village during last year to visit place.	41	35	24
ii) I personally visited agriculture expert for his advice about my occupation.	21	38	41
iii) I use to contact with agriculture expert who visited my village for his advice/help during last year.	41	26	33
iv) I use to visit farmers of outside my village and seek their advice.	41	28	31
v) I use to invite people who visited my village for discussion about village development during last year.	24	42	34

**Discussion:**

**Table 6.8,** showed that, in case of selected respondents the majority of the respondents always (41%) use to travel outside their village during last year to visit place, followed by (35%) sometimes use to travel outside their village during last year to visit place and never (24%) use to travel outside their village during last year to visit place.

In case of selected respondents the majority of the respondents never (41%) personally visited agriculture expert for their advice about their occupation, followed by sometimes (38%) personally visited agriculture expert for their advice about their occupation and always (21%) personally visited agriculture expert for their advice about their occupation.

In case of selected respondents the majority of the respondents always (41%) use to contact with agriculture expert who visited their village for their advice/help during last year, followed by never (33%) use to contact with agriculture expert who visited their village for their advice/help during last year and sometimes (26%) use to contact with agriculture expert who visited their village for their advice/help during last year.

In case of selected respondents the majority of the respondents always (41%) use to visit farmers of outside their village and seek their advice, followed by never (31%) use to visit farmers of outside their village and seek their advice and sometimes (28%) use to visit farmers of outside their village and seek their advice.

In case of selected respondents the majority of the respondents sometimes (42%) use to invite people who visited their village for discussion about village development during last year, followed by never (34%) use to invite people who visited their village for discussion about village development during last year and always (24%) use to invite people who visited their village for discussion about village development during last year.

**Table 6.9: Utilization of personal localite sources of information**

Source	Very often	often	Sometimes	Never
i) Local agents	40	21	9	30
ii) Local leader	12	41	11	36
iii) Friends/relative/neighbours	51	19	30	0
iv) Experienced/ progressive farmers	21	39	23	17

**Discussion:**

**Table 6.9**, it showed that, in case of selected respondents the majority of the respondents very often (40%) had utilized the personal localite sources of information from local agents, followed by never (30%) respondents had utilized the personal localite sources of information from local agents, often (21%) had utilized the personal localite sources of information from local agents and sometimes (9%) respondents had utilized the personal localite sources of information from local agents.

In case of selected respondents the majority of the respondents often (41%) had utilized the personal localite sources of information from local leaders; followed by never (36%) respondents had utilized the personal localite sources of information from local leaders, very often (12%) respondents had utilized the personal localite sources of information from local leaders and sometimes (11%) respondents had utilized the personal localite sources of information from local leaders.

In case of selected respondents the majority of the respondents very often (51%) had utilized the personal localite sources of information from friends/ relative/neighbors, followed by sometimes (30%) respondents had utilized the personal localite sources of information from friends/relative/neighbors, often (19%) respondents had utilized the personal localite sources of information from friends/ relative/neighbors and there had no any respondents in never category.

In case of selected respondents the majority of the respondents often (39%) had utilized the personal localite sources of information from experienced/ progressive farmers, followed by sometimes (23%) respondents had utilized the personal localite sources of information from experienced/ progressive farmers, very often (21%) had utilized the personal localite sources of information from experienced/ progressive farmers and never (17%) respondents had utilized the personal localite sources of information from experienced/ progressive farmers.

**Table 6.10: Contact with extension personal**

<b>S N</b>	<b>Extension worker</b>	<b>Most often</b>	<b>Oft en</b>	<b>Someti mes</b>	<b>Rare ly</b>	<b>Nev er</b>
1	A.D.O.	12	18	27	14	29
2	B.D.O.	13	21	35	7	24
3	Agril supervisor	18	11	24	37	10
4	Agril officer (T & V)	41	9	6	31	13
5	Agril scientist	21	14	8	21	36
6	Fertilizer dealer	61	17	4	12	6

7	Private company(seed/pesticide )	9	11	6	21	53
---	----------------------------------	---	----	---	----	----

**Discussion:**

**Table 6.10**, it showed that, in case of selected respondents the majority of the respondents never (29%) had contact with Agriculture development officer (A.d.o.), followed by sometimes (27%) had contact with Agriculture development officer (A.d.o.), often (18%) had contact with Agriculture development officer (A.d.o.), rarely (14%) had contact with Agriculture development officer (A.d.o.) and most often (12%) had contact with Agriculture development officer (A.d.o.)

In case of selected respondents the majority of the respondents sometimes (35%) had contact with Block development officer (B.d.o.), followed by never (24%) had contact with Block development officer (B.d.o.), often (21%) had contact with Block development officer (B.d.o.), most often (13%) had contact with Block development officer (B.d.o.) and rarely (7%) had contact with Block development officer (B.d.o).

In case of selected respondents the majority of the respondents rarely (37%) had contact with agril supervisor, followed by sometimes (24%) had contact with agril supervisor, most often (18%) had contact with agril supervisor, often (11%) had contact with agril supervisor and never (10%) had contact with agril supervisor.

In case of selected respondents the majority of the respondents most often (41%) had contact with agril officer (t & v), followed by rarely (31%) had contact with agril officer (t & v), never (13%) had contact with agril officer (t & v), often (9%) had contact with agril officer (t & v), and sometimes (6%) had contact with agril officer (t & v).

In case of selected respondents the majority of the respondents never (36%) had contact with agril scientist, followed by rarely and most often (21%) had contact with agril scientist, often (14%) had contact with agril scientist, and sometimes (8%) had contact with agril scientist.

In case of selected respondents the majority of the respondents most often (61%) had contact with fertilizer dealer, followed by often (17%) had contact with fertilizer dealer, rarely (12%) had contact with fertilizer dealer, never (6%) had contact with fertilizer dealer, and sometimes (4%) had contact with fertilizer dealer.

In case of selected respondents the majority of the respondents never (53%) had contact with private company (seed/pesticide), followed by rarely (21%) had contact with private company (seed/pesticide), often (11%) had contact with private company (seed/pesticide), most often (9%) had contact with private company (seed/pesticide), and sometimes (6%) had contact with private company (seed/pesticide).

**Table 6.11: Descriptive analysis of the independent and dependent variables (Conventional method of rice)**

Descriptive statistics

Change in rainfall pattern over last 20 year (X <sub>30</sub> )	100	1	10	7.11	2.622575	36.88573

Change pattern in temperature (day/night) over last 20 year ( $X_{31}$ )	100	1	10	6.85	2.562713	37.41187
Change pattern in weather disaster over last 20 year ( $X_{32}$ )	100	1	10	6.61	2.568638	38.85988
Change in seasonal pattern over last 20 year ( $X_{33}$ )	100	1	10	6.55	2.471336	37.73032
Change pattern in insect/ pests & diseases over last 20 year ( $X_{34}$ )	100	2	10	7.59	1.918828	25.281
Change pattern in weed problem over last 20 year ( $X_{35}$ )	100	1	10	5.79	2.016408	34.82569
Net return from rice ( $Y_1$ )	100	-13700	72500	4404.62	14963.82	339.7301
Expenditure on health care ( $Y_2$ )	100	140	5500	1281.17	810.5059	63.26.26294

**Table 6.11**, it presents the descriptive analysis on the distribution nature of different independent and dependent variables.

The distribution pattern of variable age ( $X_1$ ) depicts that the minimum age of the respondents was 40 and the maximum was 75. Since the age of the respondents had not been pre-categorized or pre-specified, the distribution of the age was quite natural. The mean age is 54.49 with a standard deviation of 9.449333. The coefficient of variance (CV) has been 17.34141% which indicates that the distribution of the variable has been quite consistent.

The distribution pattern of variable education ( $X_2$ ) shows the minimum education level is 0 while the maximum is 16. This shows that some of the respondents are illiterate who do not study at all while others studied as high as graduate and above. The mean education is 8.65 with a standard deviation of 3.881688. The coefficient of variance (CV) is 44.875% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family education status ( $X_3$ ) shows that the minimum rank is 1.4 while the maximum rank is 4.75. This indicates that overall family education status. It shows the minimum education level is from illiterate to graduate and above. The mean family education status is 3.2301 with a standard deviation of 0.925402. The coefficient of variance (CV) is 28.64933% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable primary occupation ( $X_{41}$ ) shows that the minimum rank is 1 while the maximum rank is 6. This indicates that farmer is minimum labour (1) and maximum doing service (6). The mean primary occupation is 3.72 with the standard deviation of 1.543243. The coefficient of variance (CV) is 41.48504% which indicates that the distribution of variable is consistent.

The distribution pattern of variable secondary occupation ( $X_{42}$ ) shows that the minimum rank is (0) while the maximum rank is (5). The zero indicates that farmer is not doing any other occupation and 5 indicate that maximum he is doing cultivation. The mean secondary occupation is 3.8 with the standard deviation of 1.667333. The coefficient of variance (CV) is 43.87719% which indicates that the distribution of variable is consistent.

The distribution pattern of variable caste ( $X_5$ ) shows that the minimum caste of farmer is (1) which means scheduled tribe category while the maximum caste of farmer is (4) which mean having general caste category. The mean caste is 2.68 with the standard deviation of 1.038075. The coefficient of variance (CV) is 38.73415% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family type ( $X_6$ ) shows that the minimum family type is 1 while the maximum family type is 2. The mean family type is 1.42 with the standard deviation of

0.493559. The coefficient of variance (CV) is 34.75764% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family size ( $X_7$ ) shows that the minimum family size is 2 while the maximum family size is 13. The mean family size is 6.43 with the standard deviation of 3.134502. The coefficient of variance (CV) is 48.74808% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family income primary ( $X_{81}$ ) shows that the minimum primary income of the respondent is as low as 247.8 while the maximum is as high as 15000. The mean primary income is 3060.249 with a standard deviation of 2354.3. The coefficient of variance (CV) is 76.93164% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family income secondary ( $X_{82}$ ) shows that the minimum secondary income of the respondent is as low as 0 while the maximum is as high as 7032.5. The mean secondary income is 1091.375 with a standard deviation of 1098.441. The coefficient of variance (CV) is 100.6474% which indicates that the distribution of variable is consistent.

The distribution pattern of variable farm size ( $X_9$ ) shows that the minimum farm size of the respondent is as low as 0.4 while the maximum is as high as 10 hectare. The mean farm size is 2.8758 with a standard deviation of 2.453884. The coefficient of variance (CV) is 85.32873% which indicates that the distribution of variable is consistent.

The distribution pattern of variable social participation ( $X_{10}$ ) shows that the minimum range is 0 while the maximum range is 4. Zero indicates that some of the respondents had no any social participation while others had as many as wider public leaders. The mean social participation is 1.17 with a standard deviation of 1.140658. The coefficient of variance (CV) is 97.49211% which indicate that the distribution of variable is consistent.

The distribution pattern of variable risk orientation ( $X_{11}$ ) shows that the minimum range of the risk orientation is 1 and the maximum range is 7. The mean risk orientation value is 4.074 with a standard deviation of 1.5304. The coefficient of variance (CV) is 37.56505% which indicates that the distribution of variable is consistent.

The distribution pattern of variable index of farm mechanization ( $X_{12}$ ) shows that the minimum range is 20 while the maximum range is 96. The mean index of farm mechanization is 50.52 with a standard deviation of 19.39458. The coefficient of variance (CV) is 38.3899% which indicate that the distribution of variable is consistent.

The distribution pattern of variable cropping intensity ( $X_{13}$ ) shows that the minimum range is 42.92 while the maximum range is 200. The mean cropping intensity is 95.3743 with a standard deviation of 32.05064. The coefficient of variance (CV) is 33.60512% which indicate that the distribution of variable is consistent.

The distribution pattern of variable selling% ( $X_{14}$ ) shows that the minimum range is 45 while the maximum range is 95.7. Minimum range indicates that some of the respondents had selling their production with 45% while others had as many as 95.7 % .The mean selling% is 78.002 with a standard deviation of 10.93099. The coefficient of variance (CV) is 14.01373% which indicate that the distribution of variable is consistent.

The distribution pattern of variable debt ( $X_{15}$ ) shows that the minimum range is 0 while the maximum range is 1. Minimum range indicates that some of the respondents do not have any type debt while some of the respondents having debt which they had taken from the bank or any other financial agencies for their cultivation practices. The mean value of debt is 0.7 with a standard deviation of 0.458258. The coefficient of variance (CV) is 65.46537% which indicate that the distribution of variable is consistent.

The distribution pattern of variable migration ( $X_{16}$ ) shows that the minimum range is 0 while the maximum range is 1. Minimum range indicates that some of the respondents do not want to migrate from one place to another place while some of the respondents want to migrate from one place to another place due to highly impact of climate change on their net return from rice production. The mean value of migration is 0.12 with a standard deviation of 0.324962. The coefficient of variance (CV) is 270.8016% which indicate that the distribution of variable is consistent.

The distribution pattern of variable mass media exposure ( $X_{17}$ ) shows that some of the respondents had a media exposure as low as 0.33 while others had as high as 3.33. The mean value is 1.6104 with a standard deviation of 0.669193. The coefficient of variance (CV) is 41.55448% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable utilization of personal cosmopolite sources of information ( $X_{18}$ ) shows that some of the respondents had a utilization of personal cosmopolite sources of information as low as 0.2 while others had as high as 3. The mean value is 1.52 with a standard deviation of 0.789937. The coefficient of variance (CV) is 51.96952% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable utilization of personal localite sources of information ( $X_{19}$ ) shows that some of the respondents had a utilization of personal localite sources of information as low as 0.25 while others had as high as 3. The mean value is 1.694 with a standard deviation of 0.769717. The coefficient of variance (CV) is 45.43783% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable contact with extension personal ( $X_{20}$ ) shows that some of the respondents had a contact with extension personal as low as 0.14 while others had as high as 3.71. The mean value is 1.6409 with a standard deviation of 0.923372. The coefficient of variance (CV) is 56.2723% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable seed rate% ( $X_{21}$ ) shows that some of the respondents had a seed rate % as low as 90% while others had as high as 157.5% as per the recommended seed rate is 40 Kg/h. The mean value is 119.35 with a standard deviation of 16.90643. The coefficient of variance (CV) is 14.16542% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable fertilizer% ( $X_{22}$ ) shows that some of the respondents had a fertilizer % as low as 53.3 % while others had as high as 133.3% as per the state govt. recommended fertilizer dose is (100 kg N, 50 Kg P, & 50 Kg K/h.). The mean value is 96.212 with a standard deviation of 18.68361. The coefficient of variance (CV) is 19.41921% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable pesticide% ( $X_{23}$ ) shows that some of the respondents had a pesticide % as low as 33.3% while others had as high as 400% as per the state govt. recommended pesticide dose is (Fungicide-Tricyclazole WP 75-0.6g/litre).The mean value is 149.747 with a standard deviation of 73.87725. The coefficient of variance (CV) is 49.33471% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable weed management% ( $X_{24}$ ) shows that some of the respondents had a weed management% as low as 53.3% while others had as high as 186.6% as per the state govt. recommended herbicide dose is 1.5 kg (a.i.) per hectare. The mean value is 107.885 with a standard deviation of

27.84443. The coefficient of variance (CV) is 25.80936% which indicates that the distribution of the variable is consistent

The distribution pattern of variable water management% ( $X_{25}$ ) shows that some of the respondents had a water management% as low as 0% while others had as high as 104% as per the state govt. recommended water management required in every crop growth stages. Zero indicate that some of the respondents do not have the irrigation sources and fully dependent on rainfall. The mean value is 58.62 with a standard deviation of 38.04465. The coefficient of variance (CV) is 64.90047% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable irrigation index ( $X_{26}$ ) shows that some of the respondents had an irrigation index as low as 0 % while others had as high as 88.7%. Zero indicates that some of the respondents do not have the irrigation sources. The mean value is 39.338 with a standard deviation of 29.16121. The coefficient of variance (CV) is 74.12987% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable sowing time ( $X_{27}$ ) shows that some of the respondents had a sowing time as low as 1 while others had as high as 4. Rank 1 indicates the sowing time is in between 15 June to 25 June while rank 4 indicates the sowing time is in between 16 July to 25 July. The mean value is 2.21 with a standard deviation of 1.210744. The coefficient of variance (CV) is 54.78478% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable varietal change ( $X_{28}$ ) shows that some of the respondents had a varietal change as low as 0 % while others had as high as 1. Zero indicates that some of the respondents had been changed the variety every year due to any other reason while 1 indicates that some of the respondents had been changed the variety every year due to climate change. The mean value is 0.58 with a standard deviation of 0.493559. The coefficient of variance (CV) is 85.09629% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable farm power ( $X_{29}$ ) shows that some of the respondents had a farm power as low as 0% while others had as high as 6. Zero indicates that some of the respondents do not have the draught animal while 6 indicate as high as 5-6 draught animals. The mean value is 3.22 with a standard deviation of 1.997899. The coefficient of variance (CV) is 62.04655% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change in rainfall pattern over last 20 year ( $X_{30}$ ) shows that some of the respondents had a change in rainfall pattern over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change in rainfall pattern for minimum (1) and maximum (10) in 0-10 scale. The mean value is 7.11 with a standard deviation of 2.622575. The coefficient of variance (CV) is 36.88573% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change pattern in temperature (day/night) over last 20 year ( $X_{31}$ ) shows that some of the respondents had a change pattern in temperature (day/night) over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change pattern in temperature (day/night) for minimum (1) and maximum (10) in 0-10 scale. The mean value is 6.85 with a standard deviation of 2.562713. The coefficient of variance (CV) is 37.41187% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change pattern in weather disaster over last 20 year ( $X_{32}$ ) shows that some of the respondents had a change pattern in weather disaster over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change pattern in weather disaster for minimum (1) and maximum (10) in 0-10 scale. The mean value is 6.61 with a standard deviation of 2.568638. The coefficient of variance (CV) is 38.85988% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change in seasonal pattern over last 20 year ( $X_{33}$ ) shows that some of the respondents had a change in seasonal pattern over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change in seasonal pattern for minimum (1) and maximum (10) in 0-10 scale. The mean value is 6.55 with a standard deviation of 2.471336. The coefficient of variance (CV)

is 37.73032% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change pattern in insect/ pests & diseases over last 20 year ( $X_{34}$ ) shows that some of the respondents had a change pattern in insect/ pests & diseases over last 20 year as low as 2 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change pattern in insect/ pests & diseases for minimum level (1) and maximum level (10) in 0-10 scale. The mean value is 7.59 with a standard deviation of 1.918828. The coefficient of variance (CV) is 25.281% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change pattern in weed problem over last 20 year ( $X_{35}$ ) shows that some of the respondents had a change pattern in weed problem over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change pattern in weed problem for minimum level (1) and maximum level 10 in 0-10 scales. The mean value is 5.79 with a standard deviation of 2.016408. The coefficient of variance (CV) is 34.82569% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable net return from rice ( $Y_1$ ) shows that some of the respondents had a net return from rice as low as -13700 while others had as high as 72500. Negative sign is for fully loss in rice production due to climate change. The mean value is 4404.62 with a standard deviation of 14963.82.

The coefficient of variance (CV) is 339.7301% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable expenditure on health care ( $Y_2$ ) shows that some of the respondents had expenditure on health care as low as 140 while others had as high as 5500. The mean value is 1281.17 with a standard deviation of 810.5059. The coefficient of variance (CV) is 63.26.26294% which indicates that the distribution of the variable is consistent.

**Table 6.12: Descriptive analysis of the independent and dependent variables (SRI) System of rice intensification method**

Descriptive statistics						
Variables	N	Minimum	Maximum	Mean	Std. deviation	CV (%)
Age ( $X_1$ )	100	41	78	56.15	9.83	17.51
Education ( $X_2$ )	100	0	16	8.42	4.03	47.90
Family education status ( $X_3$ )	100	1	4.75	2.70	0.98	36.17
Primary occupation ( $X_{41}$ )	100	1	6	4.04	1.44	35.68
Secondary occupation ( $X_{42}$ )	100	0	5	3.47	2.04	58.84
Caste ( $X_5$ )	100	1	4	2.61	1.09	41.58
Family type ( $X_6$ )	100	1	2	1.46	0.50	34.14

Family size( $X_7$ )	100	2	13	6.02	2.87	47.74
Family income primary ( $X_{81}$ )	100	219.85	13864.3	4543.6 2	3424.09	75.36
Family income secondary ( $X_{82}$ )	100	0	8533.33	803.15	1183.27	147.3 3
Farm size ( $X_9$ )	100	0.4	6.87	2.27	1.55	68.55
Social participation ( $X_{10}$ )	100	0	4	1.40	1.36	96.89
Risk orientation ( $X_{11}$ )	100	1	7	3.79	1.99	52.57
Index of farm mechanization ( $X_{12}$ )	100	24	98	58.08	19.83	34.15

Change pattern in weed problem over last 20 year ( $X_{35}$ )	100	4	10	8.49	1.57	18.51
Net return from rice ( $Y_1$ )	100	-4600	120000	36830.22	28804.87	78.21
Expenditure on health care ( $Y_2$ )	100	112.5	3125	1064.42	482.45	45.33

**Table 6.12**, it presents the descriptive analysis on the distribution nature of different independent and dependent variables.

The distribution pattern of variable age ( $X_1$ ) depicts that the minimum age of the respondents was 41 and the maximum was 78. Since the age of the respondents had not been pre-categorized or pre-specified, the distribution of the age was quite natural. The mean age is 56.15 with a standard deviation of 9.83. The coefficient of variance (CV) has been 17.51% which indicates that the distribution of the variable has been quite consistent.

The distribution pattern of variable education ( $X_2$ ) shows the minimum education level is 0 while the maximum is 16. This shows that some of the respondents are illiterate who do not study at all while others studied as high as graduate and above. The mean education is 8.42 with a standard deviation of 4.03.

The coefficient of variance (CV) is 47.90% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family education status ( $X_3$ ) shows that the minimum rank is 1 while the maximum rank is 4.75. This indicates that overall family education status. It shows the minimum education level is from illiterate to graduate and above. The mean family education status is 2.70 with a standard deviation of 0.98. The coefficient of variance (CV) is 36.17% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable primary occupation ( $X_{41}$ ) shows that the minimum rank is 1 while the maximum rank is 6. This indicates that farmer is minimum labour (1) and maximum doing service (6). The mean primary occupation is 4.04 with the standard deviation of 1.44. The coefficient of variance (CV) is 35.68% which indicates that the distribution of variable is consistent.

The distribution pattern of variable secondary occupation ( $X_{42}$ ) shows that the minimum rank is (0) while the maximum rank is (5). The zero indicates that farmer is not doing any other occupation and 5 indicate that maximum he is doing cultivation. The mean secondary occupation is 3.47 with the standard deviation of 2.04. The coefficient of variance (CV) is 58.84% which indicates that the distribution of variable is consistent.

The distribution pattern of variable Caste ( $X_5$ ) shows that the minimum caste of farmer is (1) which means scheduled tribe

category while the maximum caste of farmer is (4) which mean having general caste category. The mean caste is 2.61 with the standard deviation of 1.09. The coefficient of variance (CV) is 41.58% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family type ( $X_6$ ) shows that the minimum family type is 1 while the maximum family type is 2. The mean family type is 1.46 with the standard deviation of 0.50. The coefficient of variance (CV) is 34.14% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family size ( $X_7$ ) shows that the minimum family size is 2 while the maximum family size is 13. The mean family size is 6.02 with the standard deviation of 2.87. The coefficient of variance (CV) is 47.74% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family income primary ( $X_{81}$ ) shows that the minimum primary income of the respondent is as low as 219.85 while the maximum is as high as 13864.3. The mean primary income is 4543.62 with a standard deviation of 3424.09 .The coefficient of variance (CV) is 75.36% which indicates that the distribution of variable is consistent.

The distribution pattern of variable family income secondary ( $X_{82}$ ) shows that the minimum secondary income of the respondent is as low as 0 while the maximum is as high as 8533.33. The mean secondary income is 803.15 with a standard

deviation of 1183.27. The coefficient of variance (CV) is 147.33% which indicates that the distribution of variable is consistent.

The distribution pattern of variable farm size ( $X_9$ ) shows that the minimum farm size of the respondent is as low as 0.4 while the maximum is as high as 6.87 hectare. The mean farm size is 2.27 with a standard deviation of 1.55. The coefficient of variance (CV) is 68.55% which indicates that the distribution of variable is consistent.

The distribution pattern of variable social participation ( $X_{10}$ ) shows that the minimum range is 0 while the maximum range is 4. Zero indicates that some of the respondents had no any social participation while others had as many as wider public leaders. The mean social participation is 1.40 with a standard deviation of 1.36. The coefficient of variance (CV) is 96.89% which indicate that the distribution of variable is consistent.

The distribution pattern of variable risk orientation ( $X_{11}$ ) shows that the minimum range of the risk orientation is 1 and the maximum range is 7. The mean risk orientation value is 3.79 with a standard deviation of 1.99. The coefficient of variance (CV) is 52.57% which indicates that the distribution of variable is consistent.

The distribution pattern of variable index of farm mechanization ( $X_{12}$ ) shows that the minimum range is 24 while the maximum range is 98. the mean index of farm mechanization is 58.08 with a standard deviation of 19.83. The coefficient of

variance (CV) is 34.15% which indicate that the distribution of variable is consistent.

The distribution pattern of variable cropping intensity ( $X_{13}$ ) shows that the minimum range is 50 while the maximum range is 175.7. The mean cropping intensity is 98.02 with a standard deviation of 27.50. The coefficient of variance (CV) is 28.06% which indicate that the distribution of variable is consistent.

The distribution pattern of variable selling% ( $X_{14}$ ) shows that the minimum range is 40 while the maximum range is 93.8. Minimum range indicates that some of the respondents had selling their production with 40% while others had as many as 93.8% .The mean selling% is 75.63 with a standard deviation of 13.29. The coefficient of variance (CV) is 17.57% which indicate that the distribution of variable is consistent.

The distribution pattern of variable debt ( $X_{15}$ ) shows that the minimum range is 0 while the maximum range is 1. Minimum range indicates that some of the respondents do not have any type debt while some of the respondents having debt which they had taken from the bank or any other financial agencies for their cultivation practices. The mean value of debt is 0.79 with a standard deviation of 0.41. The coefficient of variance (CV) is 51.56% which indicate that the distribution of variable is consistent.

The distribution pattern of variable migration ( $X_{16}$ ) shows that the minimum range is 0 while the maximum range is 1. Minimum range indicates that some of the respondents do not want to

migrate from one place to another place while some of the respondents want to migrate from one place to another place due to highly impact of climate change on their net return from rice production. The mean value of migration is 0.08 with a standard deviation of 0.27. The coefficient of variance (CV) is 337.5% which indicate that the distribution of variable is consistent.

The distribution pattern of variable mass media exposure ( $X_{17}$ ) shows that some of the respondents had a media exposure as low as 0.33 while others had as high as 3.16. The mean value is 1.72 with a standard deviation of 0.70. The coefficient of variance (CV) is 40.98% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable utilization of personal cosmopolite sources of information ( $X_{18}$ ) shows that some of the respondents had a utilization of personal cosmopolite sources of information as low as 0.2 while others had as high as 3. The mean value is 1.48 with a standard deviation of 0.85. The coefficient of variance (CV) is 57.67% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable utilization of personal localite sources of information ( $X_{19}$ ) shows that some of the respondents had a utilization of personal localite sources of information as low as 0.25 while others had as high as 3. The mean value is 1.61 with a standard deviation of 0.83. The coefficient of variance (CV) is 51.67% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable contact with extension personal ( $X_{20}$ ) shows that some of the respondents had a contact with extension personal as low as 0.14 while others had as high as 3.42. The mean value is 1.40 with a standard deviation of 0.76. The coefficient of variance (CV) is 53.95% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable seed rate% ( $X_{21}$ ) shows that some of the respondents had a seed rate% as low as 100% while others had as high as 480% as per the recommended seed rate is 5 Kg/h. The mean value is 221.00 with a standard deviation of 96.27. The coefficient of variance (CV) is 43.56% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable fertilizer% ( $X_{22}$ ) shows that some of the respondents had a fertilizer% as low as 53.3% while others had as high as 130.3% as per the state govt. it required 8 to 10 metric tonne organic manure/ hectare before puddling in the field. 3kg azospyrilym/ hectare and another use of green manuring crop- *Subabul*, *dhencha*, *boru* etc. If it is not possible then use 50 % green manuring and 50 % recommended dose of N, P & k. (100:5050).The mean value is 94.60 with a standard deviation of 15.45. The coefficient of variance (CV) is 16.33% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable pesticide% ( $X_{23}$ ) shows that some of the respondents had a pesticide% as low as 70 % while others had as high as 240 % as per the state govt. recommended pesticide dose is (Insecticide-Carbofuron 3g @

1kg (a.i) per hectare. The mean value is 116.70 with a standard deviation of 36.53. The coefficient of variance (CV) is 31.30% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable weed management% ( $X_{24}$ ) shows that some of the respondents had a weed management% as low as 72.6% while others had as high as 193.3% as per the state govt. recommended herbicide dose is 1.5 kg (a.i.) per hectare. The mean value is 110.668 with a standard deviation of 25.43. The coefficient of variance (CV) is 22.99% which indicates that the distribution of the variable is consistent

The distribution pattern of variable water management% ( $X_{25}$ ) shows that some of the respondents had a water management% as low as 62.5% while others had as high as 125% as per the state govt. recommended water management required in every crop growth stages. The mean value is 95.02 with a standard deviation of 13.27. The coefficient of variance (CV) is 13.96% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable irrigation index ( $X_{26}$ ) shows that some of the respondents had an irrigation index as low as 40% while others had as high as 100%. The mean value is 85.79 with a standard deviation of 13.82. The coefficient of variance (CV) is 16.11% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable sowing time ( $X_{27}$ ) shows that some of the respondents had a sowing time as low as 1 while others had as high as 3. Rank 1 indicates the sowing time is

in between 15 July to 23 July while rank 3 indicates the sowing time is in between 1 August to 8 August. The mean value is 1.92 with a standard deviation of 0.82. The coefficient of variance (CV) is 42.75% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable varietal change ( $X_{28}$ ) shows that some of the respondents had a varietal change as low as 0% while others had as high as 1. Zero indicates that some of the respondents had been changed the variety every year due to any other reason while 1 indicates that some of the respondents had been changed the variety every year due to climate change. The mean value is 0.64 with a standard deviation of 0.48. The coefficient of variance (CV) is 75.00% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable farm power ( $X_{29}$ ) shows that some of the respondents had a farm power as low as 0% while others had as high as 6. Zero indicates that some of the respondents do not have the draught animal while 6 indicate as high as 5-6 draught animals. The mean value is 2.70 with a standard deviation of 2.01. The coefficient of variance (CV) is 74.35% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change in rainfall pattern over last 20 year ( $X_{30}$ ) shows that some of the respondents had a change in rainfall pattern over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent

response over the change in rainfall pattern for minimum (1) and maximum (10) in 0-10 scale. The mean value is 7.01 with a standard deviation of 2.16. The coefficient of variance (CV) is 30.83% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change pattern in temperature (day/night) over last 20 year ( $X_{31}$ ) shows that some of the respondents had a change pattern in temperature (day/night) over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change pattern in temperature (day/night) for minimum (1) and maximum (10) in 0-10 scale. The mean value is 6.27 with a standard deviation of 2.22. The coefficient of variance (CV) is 35.44% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change pattern in weather disaster over last 20 year ( $X_{32}$ ) shows that some of the respondents had a change pattern in weather disaster over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change pattern in weather disaster for minimum (1) and maximum (10) in 0-10 scale. The mean value is 6.09 with a standard deviation of 2.36. The coefficient of variance (CV) is 38.79% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change in seasonal pattern over last 20 year ( $X_{33}$ ) shows that some of the respondents had a

change in seasonal pattern over last 20 year as low as 1 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change in seasonal pattern for minimum (1) and maximum (10) in 0-10 scale. The mean value is 6.11 with a standard deviation of 2.39. The coefficient of variance (CV) is 39.14% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable Change pattern in insect/ pests & diseases over last 20 year ( $X_{34}$ ) shows that some of the respondents had a change pattern in insect/ pests & diseases over last 20 year as low as 2 while others had as high as 10. Rank 1 & 10 indicates the respondent response over the change pattern in insect/ pests & diseases for minimum level (2) and maximum level (10) in 0-10 scale. The mean value is 8.01 with a standard deviation of 2.28. The coefficient of variance (CV) is 28.44% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable change pattern in weed problem over last 20 year ( $X_{35}$ ) shows that some of the respondents had a change pattern in weed problem over last 20 year as low as 4 while others had as high as 10. The mean value is 8.49 with a standard deviation of 1.57. The coefficient of variance (CV) is 18.51% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable net return from rice ( $Y_1$ ) shows that some of the respondents had a net return from rice as

low as -4600 while others had as high as 120000. The mean value is 36830.22 with a standard deviation of 28804.87. The coefficient of variance (CV) is 78.21% which indicates that the distribution of the variable is consistent.

The distribution pattern of variable expenditure on health care ( $Y_2$ ) shows that some of the respondents had expenditure on health care as low as 112.5 while others had as high as 3125. The mean value is 1064.42 with a standard deviation of 482.45. The coefficient of variance (CV) is 45.33% which indicates that the distribution of the variable is consistent.

## Discussion

**Table 6.13**, it presents the correlation between net return from rice ( $Y_1$ ) and 35 independent variables. It has been found that the variable, farm size, water management%, irrigation index% has recorded a significant and positive correlation with the dependent

variable net return from rice with 1% level of significance, while the variable secondary occupation has recorded a significant and negative correlation with the dependent variable net return from rice with 1% level of significance.

The variable education, social participation, weed management% has recorded a significant and positive correlation with the dependent variable net return from rice with 5% level of significance, while the variable migration, varietal change has recorded a significant and negative correlation with the dependent variable net return from rice with 5% level of significance.

**Discussion:**

**Table 6.15,** It presents the correlation between net return from rice (Y<sub>1</sub>) and 35 independent variables. It has been found that the variable primary occupation, family income primary, farm size,

has recorded a significant and positive correlation with the dependent variable net return from rice with 1% level of significance, while the variable secondary occupation, cropping intensity, migration has recorded a significant and negative correlation with the dependent variable net return from rice with 1% level of significance.

The variable weed management% has recorded a significant and positive correlation with the dependent variable net return from rice ( $Y_1$ ) with 5% level of significance, while the variable age has recorded a significant and negative correlation with the dependent variable net return from rice ( $Y_1$ ) with 5% level of significance.

## Discussion:

**Table 6.16**, it presents the correlation between expenditure on health care (Y<sub>2</sub>) and 35 independent variables. It has been found

that the variable family education status, secondary occupation has recorded a significant and positive correlation with the dependent variable expenditure on health care ( $Y_2$ ) with 1% level of significance, while the variable family type and family size has recorded a significant and negative correlation with the dependent variable expenditure on health care ( $Y_2$ ) with 1% level of significance.

The variable age, family income primary, change pattern in temperature (day/night) over last 20 year has recorded a significant and positive correlation with the dependent variable expenditure on health care ( $Y_2$ ) with 5% level of significance, while the variable cropping intensity, water management has recorded a significant and negative correlation with the dependent variable expenditure on health care ( $Y_2$ ) with 5% level of significance

**Table 6.17: Best fitted regression equation following stepwise model of multiple regression equation for selecting most significant variables having prominent regression impact on consequent variable Net return from rice ( $Y_1$ ) and Expenditure on health care ( $Y_2$ ).**

<b>(Conventional method of rice)</b>						
Dependent variable (Y)	Regression equation (Stepwise)	Variable	R <sup>2</sup>	Adj. R <sup>2</sup>	SE (est.)	Ranking of important dependent regressors

<p>Net return from rice (<math>Y_1</math>)</p>	$Y_1 = -8213.66 - 2234.59X_{42} + 186.38 X_{26} + 2604.81 X_{10} + 99.45 X_{24}$	<p>(<math>X_{42}</math>)- Secondary occupation (<math>X_{26}</math>)- Irrigation index% (<math>X_{10}</math>)- Social participation (<math>X_{24}</math>)- Weed management%</p>	<p>0.32</p>	<p>0.292</p>	<p>12657.83</p>	<p><math>Y_1 = X_{42} &gt; X_{26} &gt; X_{10} &gt; X_{24}</math></p>
<p>Expenditure on health care (<math>Y_2</math>)</p>	$Y_2 = 2120.71 - 159.21 X_7 + 93.63 X_{11} - 0.064 X_{81}$	<p>(<math>X_7</math>)- Family size (<math>X_{11}</math>)- Risk orientation (<math>X_{81}</math>)- Family income primary</p>	<p>0.355</p>	<p>0.335</p>	<p>664.33</p>	<p><math>Y_2 = X_7 &gt; X_{11} &gt; X_{81}</math></p>

Two equations can identify the important predictors to explain Y for Conventional method of rice in the light of climate change.

**Discussion:**

**Table 6.17**, it concluded that net return from rice ( $Y_1$ ) is explained by the variable irrigation index% ( $X_{26}$ ), social participation ( $X_{10}$ ) and the variable weed management% ( $X_{24}$ ) with their positive contribution towards net return from rice ( $Y_1$ ) in the light of climate change, while the variable secondary occupation ( $X_{42}$ ) with its negative impact towards reducing the

magnitude of net return from rice ( $Y_1$ ) in the light of climate change. Total variance explained by such equation is 32% and all predictors in this equation have resulted significant regression coefficient to explain net return from Rice ( $Y_1$ ) in the light of climate change.

Then it can be further concluded that expenditure on health care ( $Y_2$ ) is explained by the variable risk orientation ( $X_{11}$ ) with their positive contribution towards expenditure on health care ( $Y_2$ ) in the light of climate change, while the variable family size ( $X_7$ ) and family income primary ( $X_{81}$ ) with its negative impact towards reducing the magnitude of expenditure on health care ( $Y_2$ ) in the light of climate change. Total variance explained by such equation is 35.50% and all predictors in this equation have resulted significant regression coefficient to explain expenditure on health care ( $Y_2$ ) in the light of climate change.

**Table 6.18: Best fitted regression equation following stepwise model of multiple regression equation for selecting most significant variables having prominent regression impact on consequent variable Net return from rice ( $Y_1$ ) and Expenditure on health care ( $Y_2$ ).**

<b>(System of rice intensification method )</b>						
<b>Dependent variable (Y)</b>	<b>Regression equation(Step wise)</b>	<b>Variable</b>	<b>R<sup>2</sup></b>	<b>Adj. R<sup>2</sup></b>	<b>SE(est.)</b>	<b>Ranking of important dependent regressors</b>

Two equations can identify the important predictors to explain Y for System of rice Intensification method in the light of climate change.

## Discussion

**Table 6.18**, it concluded that net return from rice ( $Y_1$ ) is explained by the variable farm size ( $X_9$ ) and family income primary ( $X_{81}$ ) with their positive contribution towards net return from rice ( $Y_1$ ) in the light of climate change, while the variable migration ( $X_{16}$ ) and utilization of personal localite sources of information ( $X_{19}$ ) with its negative impact towards reducing the magnitude of net return from rice ( $Y_1$ ) in the light of climate change. Total variance explained by such equation is 83.80% and all predictors in this equation have resulted significant regression coefficient to explain net return from rice ( $Y_1$ ) in the light of climate change.

Then it can be further concluded that expenditure on health care ( $Y_2$ ) is explained by the variable secondary occupation ( $X_{42}$ ) with their positive contribution towards expenditure on health care ( $Y_2$ ) in the light of climate change, while the variable family size ( $X_7$ ) and cropping intensity% ( $X_{13}$ ) with its negative impact towards reducing the magnitude of expenditure on health care ( $Y_2$ ) in the light of climate change. Total variance explained by such equation is 32.40% and all predictors in this equation have resulted significant regression coefficient to explain expenditure on health care ( $Y_2$ ) in the light of climate change.

Residual effect: **0.62**

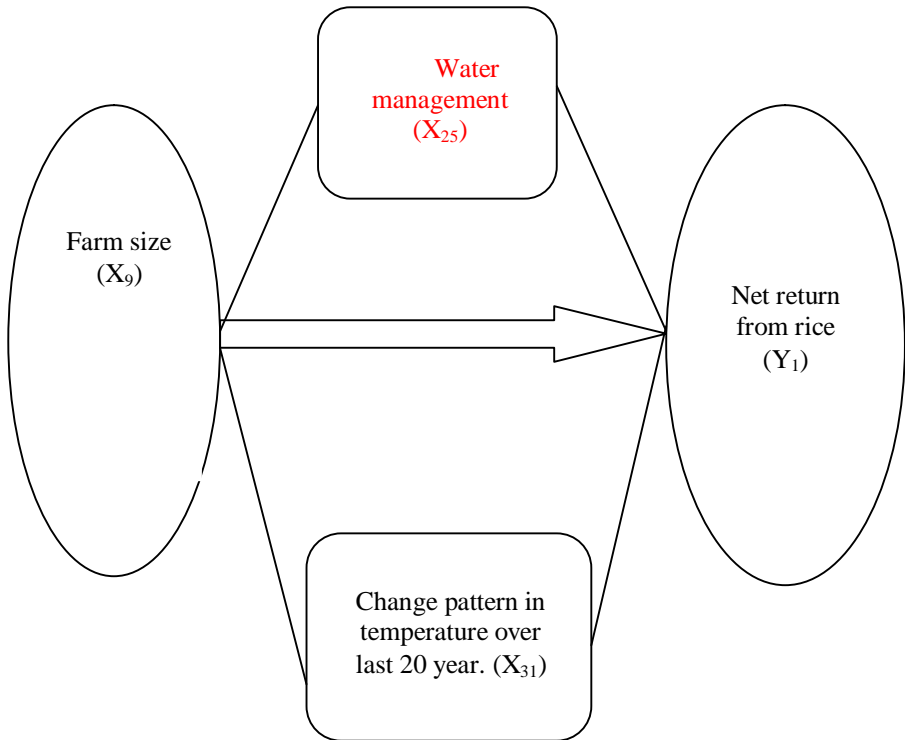

X<sub>9</sub> (Count of substantial indirect effect=18)

**Table 6.19**, it represents the path analysis to explain the direct, indirect and residual effect of exogenous variables on consequent variables i.e. net return from rice cultivation (Y<sub>1</sub>) in the light of climate change.

Results reveals that the variable farm Size (X<sub>9</sub>) exerts highest direct and water management % (X<sub>25</sub>) exerts highest indirect effect on net return from rice cultivation over the other 35 exogenous variables in the light of climate change.

The variable, farm size (X<sub>9</sub>) has been found to channelize the substantial indirect effect of, as many as, (18 times) to define its tremendous impact over the other exogenous variables to ultimately characterize the performance of consequent variable, Y<sub>1</sub> (net return from rice ) in the light of climate change.

The residual effect is 62, it could be concluded that the combination of 35 variables in this investigation in the form of exogenous variables had been able to explain 38% of the variation in the consequent variable i.e. net return from rice cultivation in the light of climate change.

**Model 1: Path analysis: Net return from rice (Y<sub>1</sub>) and 35 exogenous variables. (Conventional method of rice)**

**Table 6.20: Path analysis: direct, indirect and residual effect: exogenous variables (X<sub>1</sub>-X<sub>35</sub>) vs. Expenditure on health care (Y<sub>2</sub>).**

Residual effect: **0.67**

**X<sub>7</sub>** (Count of substantial indirect effect=14)

**Table 6.20**, It represents the path analysis to explain the direct, indirect and residual effect of exogenous variables on consequent variables i.e. expenditure on health care (Y<sub>2</sub>) in the light of climate change.

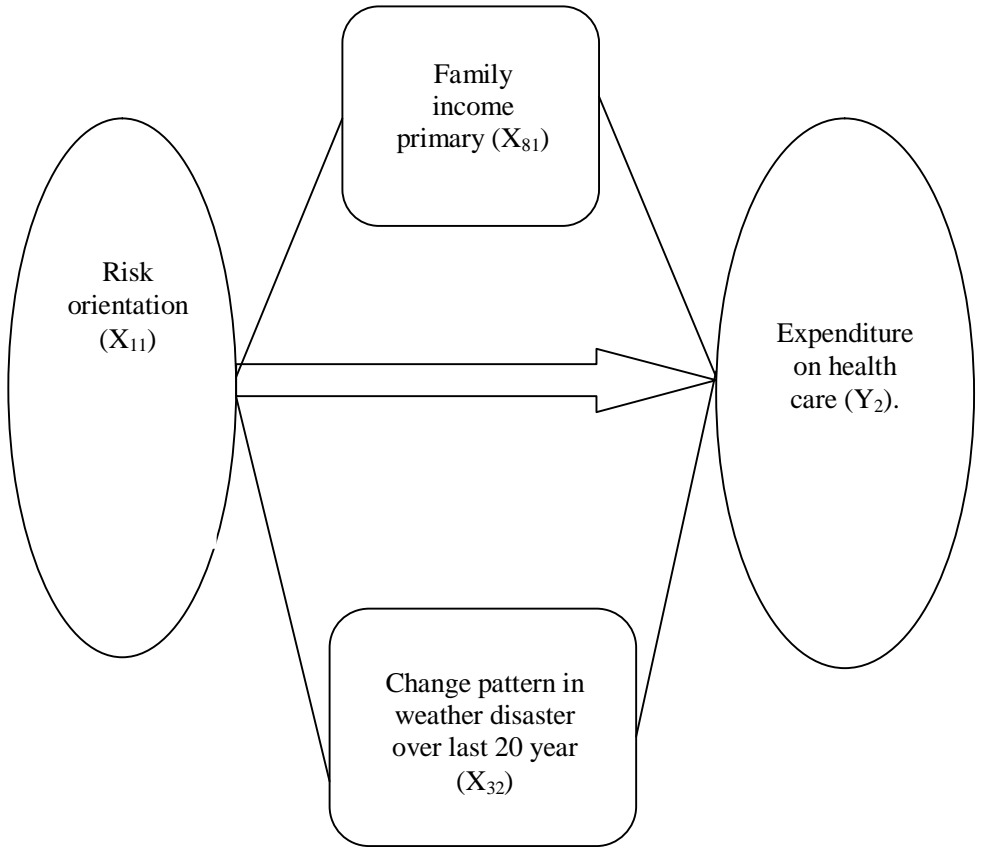

Results reveals that the variable risk orientation (X<sub>11</sub>) exerts highest direct and family income primary (X<sub>81</sub>) exerts highest indirect effect on expenditure on health care (Y<sub>2</sub>) over the other 35 exogenous variables in the light of climate change.

The variable, family size (X<sub>7</sub>) has been found to channelize the substantial indirect effect of, as many as, (14 times) to define its tremendous impact over the other exogenous variables to ultimately characterize the performance of consequent variable, expenditure on health care (Y<sub>2</sub>) in the light of climate change.

The residual effect is 67, it could be concluded that the combination of 35 variables in this investigation in the form of

exogenous variables had been able to explain 33% of the variation in the consequent variable i.e. expenditure on health care ( $Y_2$ ) in the light of climate change.

**Model 2: Path analysis: Expenditure on health care ( $Y_2$ ) and 35 exogenous variables. (Conventional method of rice)**

**Table 6.21: Path analysis: direct, indirect and residual effect: exogenous variables ( $X_1$ - $X_{35}$ ) vs. Net return from rice ( $Y_1$ ).**

Residual effect: **0.67**

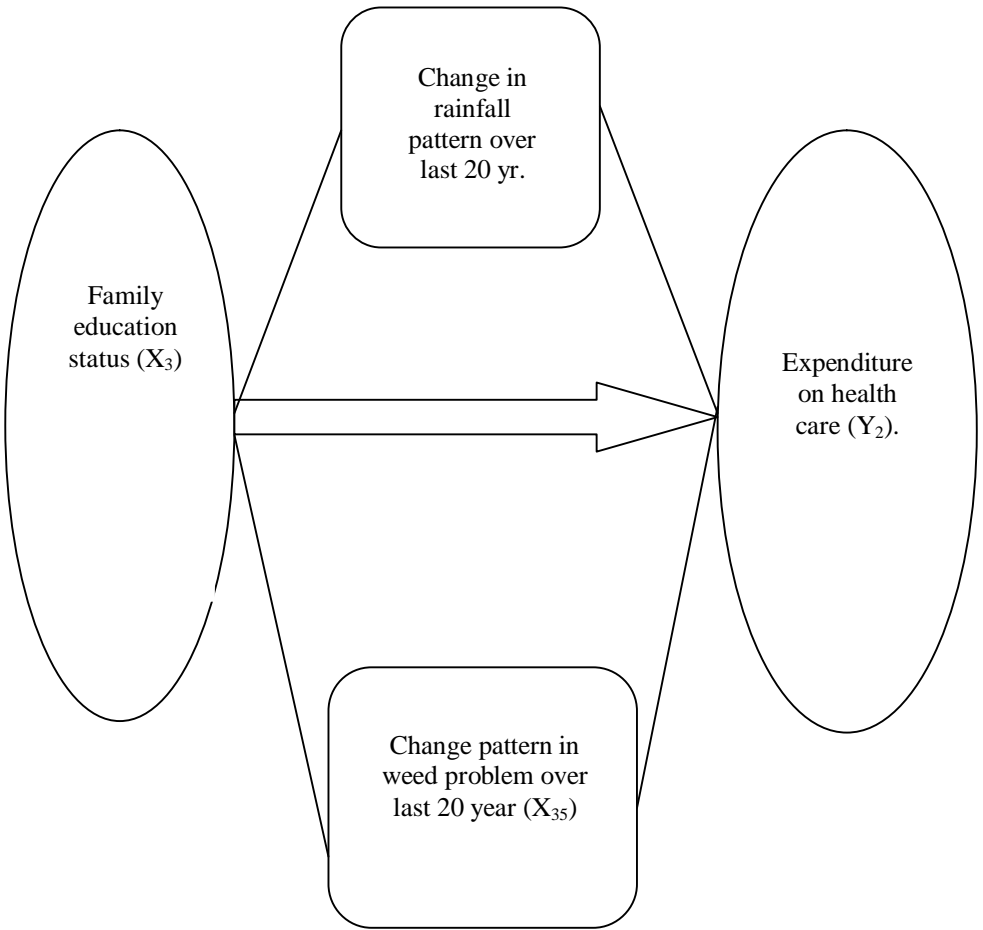

X<sub>30</sub> (Count of substantial indirect effect=12)

**Table 6.22**, it represents the path analysis to explain the direct, indirect and residual effect of exogenous variables on consequent variables i.e. expenditure on health care (Y<sub>2</sub>) in the light of climate change.

Result reveals that the variable family education status ( $X_3$ ) exerts highest direct and change in rainfall pattern over last 20 year ( $X_{30}$ ) exerts highest indirect effect on expenditure on health care ( $Y_2$ ) over the other 35 exogenous variables in the light of climate change.

The variable, change in rainfall pattern over last 20 year ( $X_{30}$ ) has been found to channelize the substantial indirect effect of, as many as, (12 times) to define its tremendous impact over the other exogenous variables to ultimately characterize the performance of consequent variable, expenditure on health care ( $Y_2$ ) in the light of climate change.

The residual effect is 67, it could be concluded that the combination of 35 variables in this investigation in the form of exogenous variables had been able to explain 33% of the variation in the consequent variable i.e. expenditure on health care ( $Y_2$ ) in the light of climate change.

**Model 4: Path analysis: Expenditure on health care (Y<sub>2</sub>) and 35 exogenous variables. (SRI method)**

**Table 6.23: Factor analysis: Indicator of impact on sustainable livelihood generation through rice production management in the light of climate change. (Conventional method of rice)**

**Conventional method of rice: Factor analysis for clubbing of variables into factor based on factor loading.**

**Factor 1**

The factor 1 is renaming as **Farm capability**. It accounted for 9.996 percent of the total data variance with 9.996 cumulative percent. Six variables having high factor loading were chosen to interpret this factor. The factor loadings were all positive. The variables and factor loading were:

<b>Variability</b>		<b>Factor loading</b>
X <sub>25</sub>	Water management	0.673
X <sub>9</sub>	Farm size	0.672
X <sub>2</sub>	Education	0.591
X <sub>26</sub>	Irrigation index%	0.546
X <sub>14</sub>	Selling%	0.332
X <sub>11</sub>	Risk orientation	0.198

**Factor 2**

The factor 2 is renaming as **Input support**. It accounted for 8.266 percent of the total data variance with 18.262 cumulative

percent. Five variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>81</sub>	Family income primary	0.474
X <sub>22</sub>	Fertilizer%	0.410
X <sub>41</sub>	Primary occupation	0.402
X <sub>3</sub>	Family education status	0.320
X <sub>23</sub>	Pesticide%	0.234

### Factor 3

The factor 3 is renaming as **Family composition**. It accounted for 7.114 percent of the total data variance with 25.376 cumulative percent. Five variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>1</sub>	Age	0.489
X <sub>24</sub>	Weed management%	0.433
X <sub>16</sub>	Migration	0.381
X <sub>7</sub>	Family size	0.297
X <sub>6</sub>	Family type	0.279

### Factor 4

The factor 4 is renaming as **Social status**. It accounted for 5.903 percent of the total data variance with 31.278 cumulative percent. Three variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>10</sub>	Social participation	0.471
X <sub>82</sub>	Family income secondary	0.448
X <sub>42</sub>	Secondary occupation	0.374

**Factor 5**

The factor 5 is renaming as **Weed management**. It accounted for 5.32 percent of the total data variance with 36.598 cumulative percent. Two variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>35</sub>	Change pattern in weed problem over last 20 years.	0.545
X <sub>29</sub>	Farm power	0.513

**Factor 6**

The factor 6 is renaming as **Resource support**. It accounted for 4.787 percent of the total data variance with 41.385 cumulative percent. Three variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>12</sub>	Index of farm mechanization	0.506
X <sub>28</sub>	Varietal change	0.400
X <sub>18</sub>	Utilization of personal cosmopolite sources of information	0.347

**Factor 7**

The factor 7 is renaming as **Weather disaster & seasonal pattern**. It accounted for 4.095 percent of the total data variance with 45.48 cumulative percent. Three variables having high factor

loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

<b>Variability</b>		<b>Factor loading</b>
X <sub>19</sub>	Utilization of personal localite sources of information	0.420
X <sub>33</sub>	Change in seasonal pattern over last 20 year	0.401
X <sub>32</sub>	Change pattern in weather disaster over last 20 year	0.387

**Factor 8**

The factor 8 is renaming as **Extension contact**. It accounted for 4.075 percent of the total data variance with 49.555 cumulative percent. Two variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

<b>Variability</b>		<b>Factor loading</b>
X <sub>21</sub>	Seed rate%	0.443
X <sub>20</sub>	Contact with extension personal	0.413

**Factor 9**

The factor 9 is renaming as **Rainfall pattern**. It accounted for 3.541 percent of the total data variance with 56.834 cumulative percent. A variables having high factor loading was chosen to interpret this factor. The factor loading was positive. The variable and factor loading was:

<b>Variability</b>		<b>Factor loading</b>
X <sub>30</sub>	Change in rainfall pattern over last 20 year	0.42

**Factor 10**

The factor 10 is renaming as **Change pattern in insect/pests and diseases**. It accounted for 3.446 percent of the total data variance with 60.28 cumulative percent. Two variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>34</sub>	Change pattern in insect/pests and diseases over last 20 year	0.569
X <sub>27</sub>	Sowing time	0.337

**Factor 11**

The factor 11 is renaming as **Exposure**. It accounted for 3.126 percent of the total data variance with 63.406 cumulative percent. A variables having high factor loading was chosen to interpret this factor. The factor loading was positive. The variable and factor loading was:

Variability		Factor loading
X <sub>30</sub>	Mass media exposure	0.338

**Factor 12**

The factor 12 is renaming as **Cropping intensity**. It accounted for 2.994 percent of the total data variance with 66.4 cumulative percent. Two variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>5</sub>	Caste	0.353
X <sub>13</sub>	Cropping intensity	0.238

**Factor 13**

The factor 13 is renaming as **Change in temperature**. It accounted for 2.874 percent of the total data variance with 69.274 cumulative percent. Two variables having high factor loading was chosen to interpret this factor. The factor loading were positive. The variable and factor loading were:

Variability		Factor loading
X <sub>31</sub>	Change pattern in temperature over last last 20 year	0.381
X <sub>15</sub>	Debt	0.339

## SRI method of rice: Factor analysis for clubbing of variables into factor based on factor loading.

### Factor 1

The factor 1 is renaming as **Family capability**. It accounted for 9.54 percent of the total data variance with 9.54 cumulative percent. Seven variables having high factor loading were chosen to interpret this factor. The factor loadings were all positive. The variables and factor loading were:

Variability		Factor loading
X <sub>9</sub>	Farm size	0.670
X <sub>81</sub>	Family income primary	0.665
X <sub>2</sub>	Education	0.519
X <sub>41</sub>	Primary occupation	0.462
X <sub>17</sub>	Mass media exposure	0.435
X <sub>3</sub>	Family education status	0.351
X <sub>27</sub>	Sowing time	0.284

### Factor 2

The factor 2 is renaming as **Weather disaster**. It accounted for 8.35 percent of the total data variance with 17.89 cumulative percent. Three variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>7</sub>	Family size	0.759
X <sub>6</sub>	Family type	0.741
X <sub>32</sub>	Change pattern in weather disaster over last 20 year	0.305

### Factor 3

The factor 3 is renaming as **Occupation mobility**. It accounted for 6.332 percent of the total data variance with 24.222 cumulative percent. Five variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>42</sub>	Secondary occupation	0.413
X <sub>82</sub>	Family income secondary	0.410
X <sub>12</sub>	Index of farm mechanization	0.363
X <sub>10</sub>	Social participation	0.305
X <sub>13</sub>	Cropping intensity	0.238

### Factor 4

The factor 4 is renaming as **Debt**. It accounted for 5.856 percent of the total data variance with 30.078 cumulative percent. Three variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>15</sub>	Debt	0.496
X <sub>29</sub>	Farm power	0.351
X <sub>19</sub>	Utilization of personal localite sources of information	0.322

### Factor 5

The factor 5 is renaming as **Extension contact**. It accounted for 5.046 percent of the total data variance with 35.124 cumulative percent. A variables having high factor loading was

chosen to interpret this factor. The factor loading was positive. The variable and factor loading was:

Variability		Factor loading
X <sub>20</sub>	Contact with extension personal	0.435

### Factor 6

The factor 6 is renaming as **Varietal change**. It accounted for 4.515 percent of the total data variance with 39.638 cumulative percent. Three variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>28</sub>	Varietal change	0.438
X <sub>11</sub>	Risk orientation	0.376
X <sub>14</sub>	Selling%	0.327

### Factor 7

The factor 7 is renaming as **Irrigation facility**. It accounted for 4.383 percent of the total data variance with 44.021 cumulative percent. Three variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>26</sub>	Irrigation index%	0.497
X <sub>18</sub>	Utilization of personal cosmopolite sources of information	0.396
X <sub>5</sub>	Caste	0.339

**Factor 8**

The factor 8 is renaming as **Change in temperature**. It accounted for 4.134 percent of the total data variance with 48.156 cumulative percent. A variables having high factor loading was chosen to interpret this factor. The factor loading was positive. The variable and factor loading was:

Variability		Factor loading
X <sub>31</sub>	Change pattern in temperature (day/night) over last 20 year	0.555

**Factor 9**

The factor 9 is renaming as **Input support**. It accounted for 3.993 percent of the total data variance with 52.148 cumulative percent. Three variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>34</sub>	Change pattern in insect/ pests and diseases over last 20 year	0.446
X <sub>22</sub>	Fertilizer%	0.407
X <sub>23</sub>	Pesticide%	0.300

**Factor 10**

The factor 10 is renaming as **Rainfall pattern**. It accounted for 3.643 percent of the total data variance with 55.792 cumulative percent. A variables having high factor loading was chosen to interpret this factor. The factor loading was positive. The variable and factor loading was:

---

Variability		Factor loading
X <sub>30</sub>	Change in rainfall pattern over last 20 year	0.371

### Factor 11

The factor 11 is renaming as **Seed rate**. It accounted for 3.283 percent of the total data variance with 59.075 cumulative percent. A variables having high factor loading was chosen to interpret this factor. The factor loading was positive. The variable and factor loading was:

Variability		Factor loading
X <sub>21</sub>	Seed rate%	0.347

### Factor 12

The factor 12 is renaming as **Water management**. It accounted for 3.098 percent of the total data variance with 62.173 cumulative percent. A variables having high factor loading was chosen to interpret this factor. The factor loading was positive. The variable and factor loading was:

Variability		Factor loading
X <sub>25</sub>	Water management%	0.236

### Factor 13

The factor 13 is renaming as **Weed management**. It accounted for 3.037 percent of the total data variance with 65.21 cumulative percent. A variables having high factor loading was chosen to interpret this factor. The factor loading was positive. The variable and factor loading was:

Variability		Factor loading
X <sub>35</sub>	Change pattern in weed problem over last 20 year	0.482

**Factor 14**

The factor 14 is renaming as **Migration**. It accounted for 2.868 percent of the total data variance with 68.078 cumulative percent. Two variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>24</sub>	Weed management%	0.355
X <sub>16</sub>	Migration	0.104

**Factor 15**

The factor 15 is renaming as **Change in seasonal pattern**. It accounted for 2.614 percent of the total data variance with 70.692 cumulative percent. Two variables having high factor loading were chosen to interpret this factor. The factor loading was positive. The variable and their factor loading were:

Variability		Factor loading
X <sub>33</sub>	Change in seasonal pattern over last 20 year	0.436
X <sub>1</sub>	Age	0.210

**Table 6.25: Problems faced by the selected respondent regarding rice production management in the light of climate change.**

**(Conventional method of rice)**

S.N.	Problem faced due to climate change	Frequency	%	Rank
1	Yield fluctuation every year due to climate change.	14	14	<b>I</b>
2	Rate of increase in insect/pests and disease every year due to unfavorable weather condition.	11	11	<b>II</b>
